Course Title	Communication Modes
GIS for Designers	Which communication modes will your course emphasize? ☐ Written ☐ Spoken ☑ Visual ☑ Technological

Learning Objectives – List the course's learning objectives below. You are encouraged to include at least one communication-specific objective. Please use bullets to separate objectives.

This course is an introduction to Geographic Information Systems (GIS) and Science (GISc) for designers.
1. Learn about the history, theory, methods, and applications of GIS.
2. Acquire, map, model, and analyze spatial and temporal data.
3. Make beautiful maps and digitally fabricated models from spatiotemporal data

Assignment Overview – C-I courses use **informal communication exercises for learning** and **formal communication exercises for demonstrating skills and knowledge** within the discipline. Briefly describe the informal & formal communication activities/projects that you will include for each mode under which you are certifying. Informal and formal activities are required for both modes.

Informal activities for Mode 1:

Students will apply visual communication methods such as GIS, cartographic, and 3D modeling that they have learned in workshops to develop their own maps.

Informal activities for Mode 2:

Students will use technological communication methods such as 3D printing as advances way to geography in 3D.

Formal activities for Mode 1:

Students will create a map at the global scale, national or state scale, and the city scale. They will also create use map overlay analysis to create suitability maps. They collect their work in a course portfolio and a final exhibition of posters.

Formal activities for Mode 2:

Students will complete a project 3D printing a city from airborne lidar data. They will project their maps onto this 3D printed city. They will learn how to host their 3D models in online repositories.

Teaching – In addition to assigning communication activities, C-I instructors are required to **teach effective communication skills** specific to the discipline. Describe your teaching efforts as they relate to your two communication modes of focus.

Visual communication methods including GIS and cartographic design will be taught in workshops in class. In terms of technological communication methods, 3D modeling and 3D printing will also be taught in workshops.

Feedback-Improvement Loop – Describe your feedback process and the opportunities students will have to incorporate your feedback for deeper learning of the two communication modes you will focus on in this course.

After students learn communication methods in instructor-led workshops, they will put their new skills to use in their projects, working individually. Each student will get feedback such as troubleshooting, planning, and critiques from the instructor during weekly project development sessions.

Grading– Outline the course grading scale to illustrate how 40% of the course grade is tied to communication-based activities**.**

All grades are based on communication activities.

Global maps 20%
National & state maps 20%
City maps 20%
Suitability maps 20%
3D printed city 15%
Portfolio 5 %

Studio Support – Describe how you will use the CxC Studios as a resource for this course (if applicable).

Students will be encouraged to use the CxC for coaching with the design of their maps, exhibitions, and booklets. CxC staff will be invited to review their work in pinups sessions to critique students' communication strategies.
