Fall 2020 Design 324.
Monday, Wednesday, & Friday
1:30pm–5:20pm.

Course Description

Digitally design and fabricate a prototype of a living green wall. This interdisciplinary studio will explore non standard construction in architecture and landscape architecture using generative processes for the design and fabrication of complex living structures. In the first section of this studio you will learn how to program 3D printers and industrial robots and then design, render, and fabricate a small ceramic form. In the second section you will design a ceramic structure for a free standing living green wall. Use a generative design process to model and analyze a family of variations on your design. Fabricate scale models of your designs. In the third section of the course you will make a detailed design, renderings, and construction documentation for your living wall. Fabricate and plant a module of your living wall. This studio will be conducted online with either remote or in person access to digital fabrication tools such as fused deposition modeling (FDM) , stereolithography (SLA), and ceramic 3D printers and industrial robots.
